

Marine algae as raw materials produced from San-in District*

by
Mitsuo KAJIMURA**

Introduction

San-in District has a long tradition in utilization of marine algae since ancient times. The present writer has reported more than 350 species of benthic marine algae including more than 240 deep-water species and comprising Chlorophyceae, Phaeophyceae and Rhodophyceae from San-in District in the course of his study on the marine algal flora in the middle to southwestern part of the Japanese coast of the Sea of Japan in the past 19 years since 1966^{1)~11)}. Among them 110 species are utilized as raw materials and reported as well as economic significance of deep-water benthic marine algae herein. San-in coast, which consists of rocky beaches and sandy ones mixed nearly half and half, is exposed to violent waves during typhoon and monsoon seasons of the year. The surface water temperature in the coast of this district ranges from 10°C in winter to 26°C in summer, while at a depth of 50m it ranges from 10°C in winter to 22°C in summer. The marine flora in this district is strongly influenced by the Tsushima Warm Current throughout the year.

Materials and Methods

This study was carried out along San-in coast extending from Oomishima, Yamaguchi Prefecture to Maizuru Bay which is in the western part of Wakasa Bay. Collections of benthic marine algae were made at 49 localities. Collections in the upper sublittoral zone were made by skin-diving, while those in the lower sublittoral regions were made with a steel dredge which the present writer designed.

Results and Conclusion

Marine algae used as food : *Monostroma latissimum*, *Monostroma nitidum*, *Ulva*

* Contribution No.25 from Oki Marine Biological Station, Shimane University.

** Marine Biological Station, Shimane University, Kamo, Saigo, Oki-gun, 685 Japan.

conglobata, *Ulva fasciata*, *Ulva pertusa*, *Enteromorpha clathrata*, *Enteromorpha compressa*, *Enteromorpha intestinalis*, *Enteromorpha linza*, *Enteromorpha plumosa*, *Enteromorpha prolifera*, *Codium fragile*, *Tinocladia crassa*, *Sphaerotrichia divaricata*, *Nemacystus decipiens*, *Endarachne binghamiae*, *Scytoniphon lomentarius*, *Petalonia fascia*, *Chorda filum*, *Eisenia bicyclis*, *Ecklonia kurome*, *Ecklonia stolonifera*, *Streptophyllopsis kuroshioensis*, *Undaria pinnatifida*, *Undaria peterseniana*, *Undaria undarioides*, *Hizikia fusiforme*, *Sargassum fulvellum*, *Bangia fuscopurpurea*, *Porphyra dentata*, *Porphyra okamurae*, *Porphyra pseudolinearis*, *Porphyra yezoensis*, *Nemalion vermiculare*, *Trichoglossa requienii*, *Helminthocladia australis*, *Helminthocladia yendoana*, *Halymenia acuminata*, *Grateloupia divaricata*, *Grateloupia filicina*, *Grateloupia imbricata*, *Grateloupia livida*, *Grateloupia okamurae*, *Grateloupia ramosissima*, *Grateloupia turuturu*, *Carpopeltis affinis*, *Gloiopeltis furcata*, *Gloiopeltis tenax*, *Schizymenia dubyi*, *Gracilaria bursa-pastoris*, *Gracilaria gigas*, *Gracilaria incurvata*, *Gracilaria textorii*, *Gracilaria verrucosa*, *Chondria crassicaulis*, *Meristotheca papulosa*.

Marine algae used as raw materials for agar : *Gelidium amansii*, *Gelidium divaricatum*, *Gelidium japonicum*, *Pterocladia capillacea*, *Pterocladia densa*, *Gracilaria bursa-pastris*, *Gracilaria gigas*, *Gracilaria textorii*, *Gracilaria verrucosa*, *Ceramium boydenii*, *Ceramium kondoi*, *Campylaephora hypnaeoides*.

Marine algae used as fertilizer : *Ulva conglobata*, *Ulva fasciata*, *Ulva pertusa*, *Enteromorpha compressa*, *Enteromorpha intestinalis*, *Enteromorpha linza*, *Enteromorpha plumosa*, *Enteromorpha prolifera*, *Chaetomorpha crassa*, *Cladophora densa*, *Cladophora wrightiana*, *Caulerpa okamurae*, *Codium contractum*, *Codium cylindricum*, *Codium divaricatum*, *Codium fragile*, *Padina arborescens*, *Padina crassa*, *Dictyota dichotoma*, *Dictyota linearis*, *Pachydictyon coriaceum*, *Dilophus okamurae*, *Spatoglossum cornigerum*, *Spatoglossum pacificum*, *Spatoglossum solieri*, *Dictyopteris divaricata*, *Dictyopteris polypodioides*, *Dictyopteris prolifera*, *Dictyopteris undulata*, *Papenfussiella kuromo*, *Hydroclathrus clathratus*, *Colpomenia sinuosa*, *Endarachne binghamiae*, *Scytoniphon lomentarius*, *Petalonia fascia*, *Punctaria latifolia*, *Chorda filum*, *Eisenia bicyclis*, *Ecklonia kurome*, *Ecklonia stolonifera*, *Undaria pinnatifida*, *Undaria peterseniana*, *Undaria undarioides*, *Cystophyllum sisymbrioides*, *Cystophyllum turneri*, *Sargassum confusum*, *Sargassum filicinum*, *Sargassum fulvellum*, *Sargassum hemiphyllum*, *Sargassum horneri*, *Sargassum kjellmanianum*, *Sargassum micracanthum*, *Sargassum nigrifolium*, *Sargassum patens*, *Sargassum pilularum*, *Sargassum ringgoldianum*, *Sargassum serratifolium*, *Sargassum thunbergii*, *Sargassum tortile*, *Sargassum yendoi*, *Bonnemaisonia hamifera*, *Asparagopsis taxiformis*, *Halymenia acuminata*, *Grateloupia divaricata*, *Grateloupia filicina*, *Grateloupia imbricata*, *Grateloupia livida*, *Grateloupia*

okamurai, *Grateloupia ramosissima*, *Grateloupia turuturu*, *Pachymeniopsis lanceolata*, *Carpopeltis affinis*, *Hypnea charoides*, *Hypnea japonica*, *Gracilaria bursa-pastoris*, *Gracilaria gigas*, *Gracilaria textorii*, *Gracilaria verrucosa*, *Gymnogongrus flabelliformis*, *Chondrus ocellatus*, *Lomentaria catenata*, *Lomentaria hakodatensis*, *Ceramium boydenii*, *Ceramium kondoi*, *Campylaephora hypnaeoides*, *Dasya scoparia*, *Dasya villosa*, *Chondria crassicaulis*, *Laurencia intermedia*, *Laurencia okamurai*, *Laurencia pinnata*.

Marine algae used as raw materials for paste : *Halymenia acuminata*, *Grateloupia divaricata*, *Grateloupia filicina*, *Grateloupia imbricata*, *Grateloupia livida*, *Grateloupia okamurai*, *Grateloupia ramosissima*, *Grateloupia turuturu*, *Pachymeniopsis lanceolata*, *Carpopeltis affinis*, *Gloioptelis furcata*, *Gloioptlis tenax*, *Gracilaria textorii*, *Gymnogongrus flabelliformis*, *Gigartina tenella*, *Chondrus ocellatus*.

Marine algae used as raw materials for alginic acid and alginates : *Eisenia bicyclis*, *Ecklonia kurome*, *Ecklonia stolonifera*, *Undaria pinnatifida*, *Undaria peterseniana*, *Undaria undariooides*.

Marine algae used as raw materials for alcohol : *Undaria pinnatifida*, *Grateloupia turuturu*.

The following four species of marine Spermatophyta are used as fertilizer as well as those algal staffs mentioned above : *Zostera caespitosa*, *Zostera marina*, *Zostera noltii*, *Phyllospadix japonicus*. *Coccophora langsdorfii* which is used as fertilizer in Hokuriku District was not collected from San-in District by the present writer. *Porphyra tenera* which is used as food in Hokuriku District was not collected from San-in District by the present writer.

Taxonomical List

CHLOROPHYCEAE

ULVALES

MONOSTROMACEAE

Monostroma latissimum (Kützing) Wittrock

Monostroma nitidum Wittrock

ULVACEAE

Ulva conglobata Kjellman

Ulva fasciata Delile

Ulva pertusa Kjellman

Enteromorpha clathrata (Roth) Greville

Enteromorpha compressa (Linné) Greville

Enteromorpha intestinalis (Linné) Link

Enteromorpha linza (Linné) J. Agardh

Enteromorpha plumosa Kützing

Enteromorpha prolifera (Müller) J. Agardh

Investigations of numerous marine algae have led to the discovery of new active medicaments and antibiotic substances. The developments in the utilization of marine algae have not come to an end, but stand at the threshold of a new era, an era for which modern technology will largely be responsible. Many details remain to be completed, especially since the coasts which not yet have been investigated hold an unknown potential of raw materials for the marine algal industry^{12),13)}.

Economic significance of deep-water benthic marine algae : Deep-water benthic marine algae are considered to have an important function as primary producer in lower sublittoral zone and directly support the productivity of herbivores and omnivores through supplying foods for them and indirectly support the productivity of carnivores. Those animals mainly comprise those taxa such as Mollusca, Arthropoda, Echinodermata, Protochordata and Pisces in Vertebrata, and include many economically important members. Deep-water benthic marine algae also considered to directly support the productivity of decomposers through supplying energy source for them and indirectly support the productivity of phyto and zoo-planktons which support productivity of many economically important animal staffs mainly comprising those taxa mentioned above as well as some other animal taxa which are considered to have an important function in the food chain such as Porifera and Annelida. On the other hand, marine meadows and forests in lower sublittoral zone are considered to have an important function in furnishing spaces not only for spawning, hatching for those various animal taxa mentioned above but also for inhabiting for larvae, fry or adults of them also.

The spores produced from those deep-water algae inhabiting widely from upper to lower sublittoral zones are considered to have a significant function in recovering the algal vegetations in area where all the local vegetations of benthic marine algae including many economically important members happened to die in upper sublittoral zone by abruptly caused extraordinary change in salinity or water temperature resulted from

heavy rainfalls or abnormal ocean currents, which is called "Isoyake" in Japanese that means the death of sea bottom.

Acknowledgement

The present writer wishes to acknowledge his great indebtedness to Professor Emeritus Dr. Jun Tokida of Hokkaido University, for his continuous encouragement.
